Final Project Individual Aim & Objectives

Title of my Project: AI-Based Mental Health Companion for Students

Aim of my Project: This project will focus on creating and engineering an AI-driven mental health companion to enhance student well being, through excellent conversational and mood monitoring as well as tailored self-care advice. The system is expected to assist students in coping with stress, anxieties, and emotional issues. This project is not aimed at substituting professional mental health services, but only the creation of a working prototype.

Objectives of my Project:

Main Objective:

To come up with an AI-based mental health companion that helps students maintain their well being by conversational AI and emotional monitoring.

Sub-Objectives:

1. To create an interface that is easy to use in interacting with students.
2. To apply the technique of AI-supported conversational support based on the NLP technique.
3. In order to add mood tracking and emotional pattern analysis functions.
4. In order to use Agile approach to deliver iterative development and feedback.
5. To measure system usability and efficiency.

Specification of my Product:

Functional and Non-Functional Activities (MoSCoW)

Functional Requirements

Must Have

- Secure system of user authentication and secure login.
- Conversational interface with AI companion textually.
- Mood tracking: This is done through various input modes (text, emoji, rating scales) and is performed on a daily basis.
- Simple emotional pattern investigation and trend visualisation.
- End-to-end data encryption of storage.

- Disclaimers and crisis helpline information put up.

Should Have

- Mood history-based personalized self-care recommendations.
- Mood trend and insight interactive dashboard.
- Several conversation topics/ themes (academic stress, social issues, overall well-being).
- Achievement badges (elements of gamification) and progress tracking.
- Mood data (PDF/CSV format) export capabilities.

Could Have

- Connection to academic calendar to notify about the stress-point.
- Voice input/output functionalities to accessibility.
- Group support features (anonymous peer sharing)
- Modern analytics based on machine learning forecasts.
- Multi-language support

Won't Have

- Professional counselling or a crisis intervention which is live.
- Clinical diagnosis abilities.
- The human moderator intervention is real-time.
- Medical advice or prescription.
- External medical record integration.

Non-Functional Requirements

- **Performance:** System response time <3 seconds per interaction.
- **Usability:** Intuitive navigation; accessible design (WCAG guidelines).
- **Security:** End-to-end encryption of sensitive information, no personal health information is stored with no prior authorization.
- **Reliability:** 99% uptime during testing phase.
- **Scalability:** Modular architecture to allow future feature addition.

Research: Academic pressure, social issues, and lifestyle change have become critical issues that have impacted student mental well being. Conventional mental health support systems are usually limited by factors such as accessibility, long wait time and stigma. Mental health companions that can be powered by AI are an alternative to manual support because they provide constant, confidential, and convenient assistance. These systems are able to mimic an empathetic conversation and offer personalized coping mechanisms using natural language processing and machine learning. Studies show that artificial intelligence companions may assist the user to be more conscious of the emotional patterns and promote healthy mental habits. Such systems are often developed using agile because of the changing user requirements and ethics. The current project examines the available AI mental health applications and uses Agile methodology to build and test a mental health companion aimed at students in a cyclic fashion.

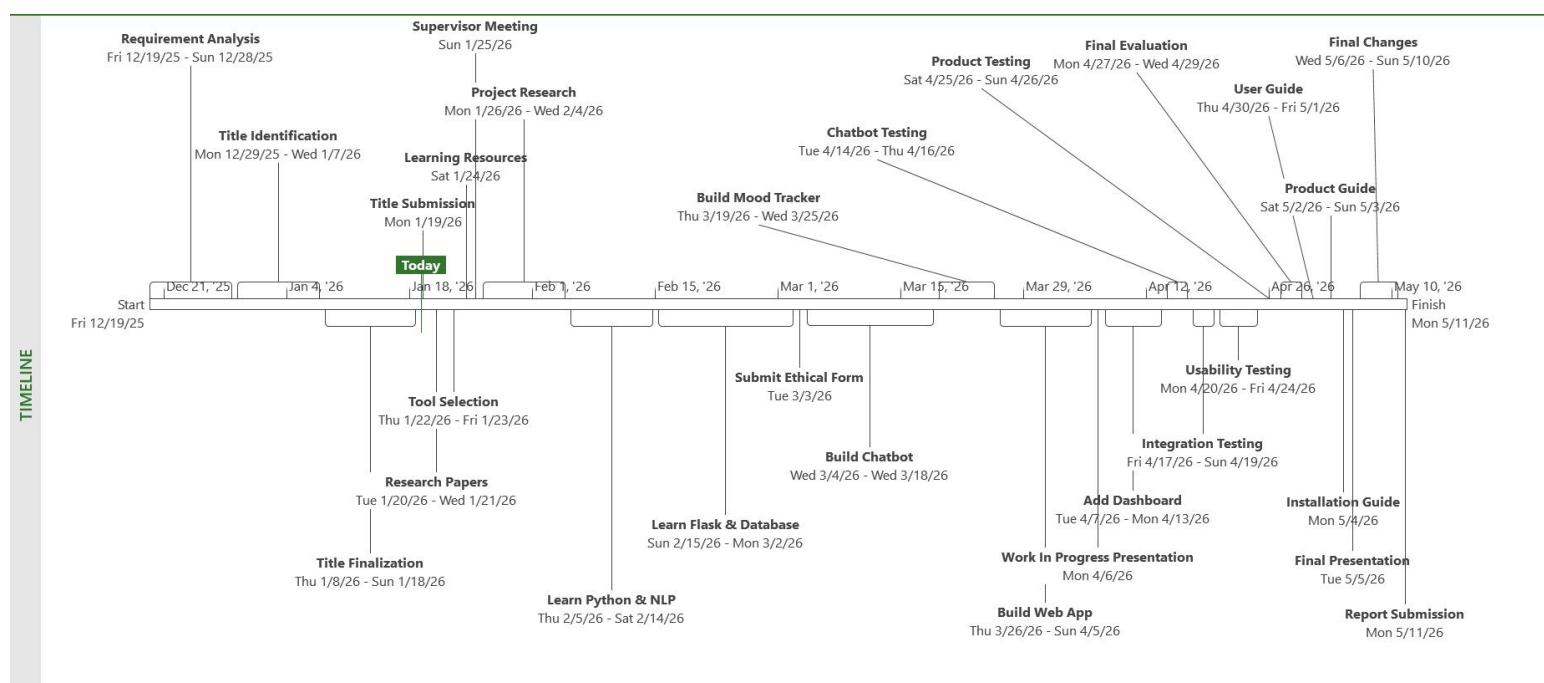

The study conducted by Fitzpatrick et al. (2017) shows that conversational AI-based agents, like Woebot, can be used successfully to provide cognitive behavioral therapy (CBT) to young adults to alleviate the symptoms of depression and anxiety by means of automated, empathetic conversations. It helps to justify the feasibility of AI companions in the form of stigma-free and easily accessible mental health tools among students.

Evaluation: The project will be measured using the usability, functionality and user satisfaction. Functional testing the basic functionality like chat interaction, mood tracking, and recommendations should be checked to ensure that they are functional. The usability test will be done by administering surveys and observation to the students. The system will also be improved by using feedback that is gathered during Agile sprint reviews. Such performance measures as response time and system reliability will also be assessed. The analysis will determine strengths, weaknesses and improvement opportunities to be made in the future to ensure that the system fulfills the desired objectives.

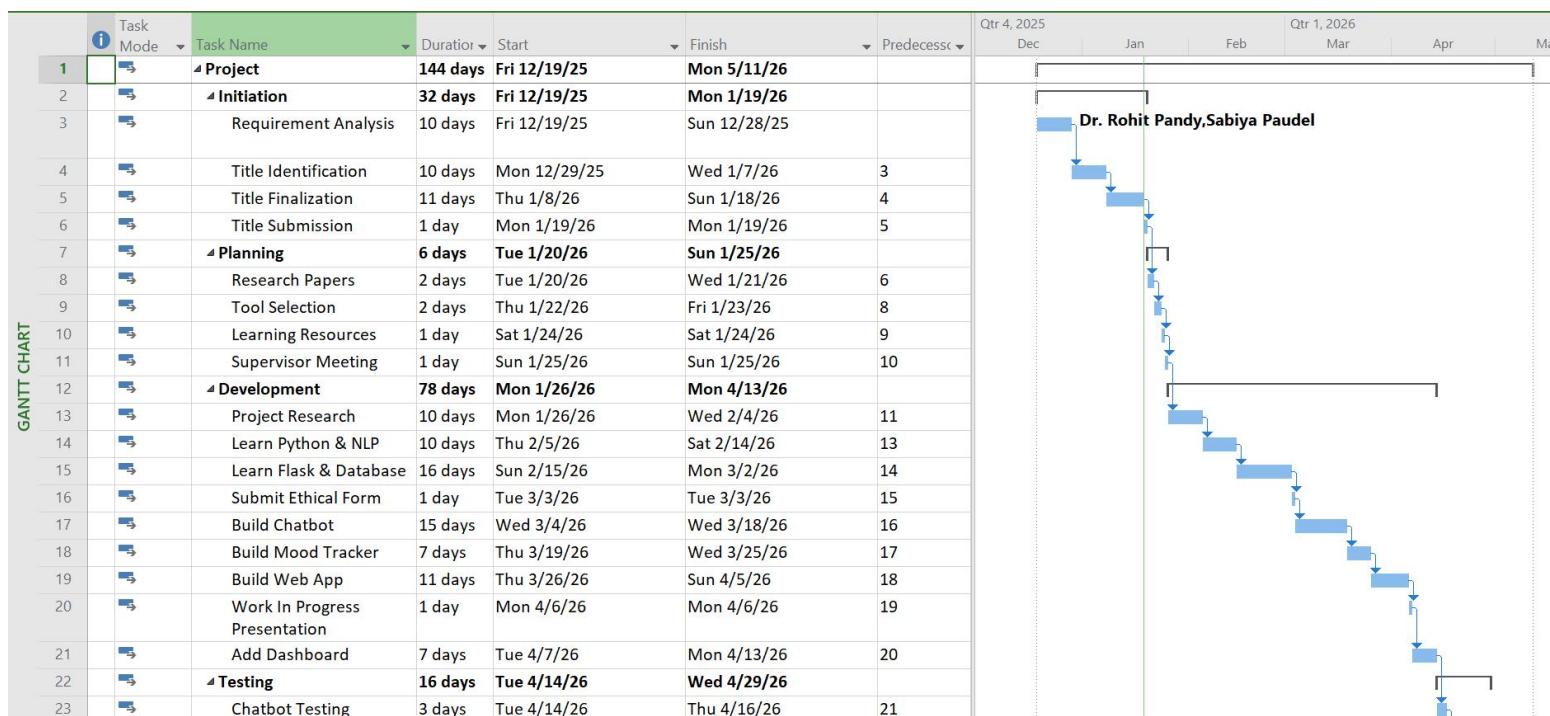

Project Planning & Methodology

Project Planning: Once the research is finished, the project is developed in iterative sprints on the basis of Agile. Every sprint is aimed at the provision of features that can be used, test them and improve them in terms of the feedback. The time required on the project is 12 weeks.

Project Timeline

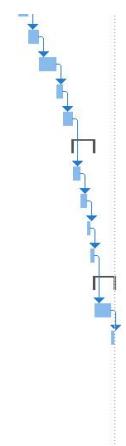

Gantt chart

GANTT CHART

24	Normal	Integration Testing	3 days	Fri 4/17/26	Sun 4/19/26	23
25	Normal	Usability Testing	5 days	Mon 4/20/26	Fri 4/24/26	24
26	Normal	Product Testing	2 days	Sat 4/25/26	Sun 4/26/26	25
27	Normal	Final Evaluation	3 days	Mon 4/27/26	Wed 4/29/26	26
28	Normal	Documentation	6 days	Thu 4/30/26	Tue 5/5/26

32	Normal	Final Presentation	1 day	Tue 5/5/26	Tue 5/5/26	31
33	Normal	Closing	6 days	Wed 5/6/26	Mon 5/11/26	
34	Normal	Final Changes	5 days	Wed 5/6/26	Sun 5/10/26	32
35	Normal	Report Submission	1 day	Mon 5/11/26	Mon 5/11/26	34

Methodology: Agile methodology (Scrum) is employed in this project because it is flexible and iterative in nature. Agile enables constant enhancement by use of short development cycles referred to as sprints. A sprint consists of planning, testing, review, and development. The user feedback is obtained on a regular basis to improve the usability and performance of the system. The Agile approach can be applied to the mental health domain as the requirements of the users are constantly changing, and ethics has to be reconsidered regularly. Agile is supported with literature in relation to the creation of user-centric software development systems that have evolving requirements.

Agile is especially appropriate to mental health applications because of the changing needs of users as well as ethical concerns. According to Hassan and Ali (2020), the Agile permits an iterative feedback and adaptive development, which is crucial in sensitive areas, such as mental health where user confidence and reliability of the system are the keys.

Resources

Hardware

Item	Specification	Source
Development Computer	Laptop/Desktop with minimum 8GB RAM, 256GB SSD	Own
Testing Devices	Smartphone (iOS/Android) for mobile testing	Own
Server Hosting	Cloud server for deployment (AWS/Azure free tier)	Cloud Provider

Software

Item	Version/Purpose	Source
IDE	Visual Studio Code / PyCharm	Free Download
Programming Language	Python 3.9+	Open Source
NLP Libraries	NLTK, spaCy, Transformers	pip install
Web Framework	React (Frontend), Flask (Backend)	npm/pip install
Database	MySQL / MongoDB	Open Source
Version Control	Git & GitHub	Free
Design Tools	Figma (UI/UX prototyping)	Free tier
Project Management	Trello/Asana for Agile tracking	Free tier

Human Resource

I am working on my Project with the following people

Name: Sabiya Paudel	Role: not needed
	Module Leader Supervisor
